

Solution Architecture

Date	02 July 2026
Team ID	
Project Name	A Comprehensive Measure of Well Being
Maximum Marks	5 Marks

Solution Architecture Diagram:

The diagram below maps the HDI Prediction System onto a Presentation Layer, Application Layer, and Data Layer, showing the technologies used at each stage of the request flow.

Component Description Table

Component Name	Description / Role in Architecture	Technologies Used
Presentation Layer	Provides the interface where users enter life expectancy, schooling, and GNI per capita, and view the predicted HDI score and development tier.	HTML5, CSS3, JavaScript (Web App)
API Gateway	Receives prediction requests from the client interface and routes the submitted indicators to the core prediction logic.	Flask (Python REST API)
Microservices	Executes the trained HDI prediction model on the submitted indicators and returns the predicted HDI score and classification tier.	Python, scikit-learn, pandas, numpy
Database	Stores the reference country-level dataset used to train and validate the HDI prediction model.	CSV dataset (UNDP Human Development Report data)

Note: Technology choices reflect the resource stack defined in the project's proposal (Flask, scikit-learn, pandas, numpy) and standard practice for this type of tool; update any component to match your actual implementation.
